                             A partial sequence (AAR88821) for Streptococcus pyogenes DNase B is the product of DNA clone lambda 2-6 (AAR12773) isolated from a spyogenes DNA library. A full-length sequence is given in AAR88823. The insert of the DNase B-encoding DNA clone can be transferred to expression plasmids for large-scale recombinant DNase produ. in E. coli or other bacterial hosts. It is used in immunoassays to detect anti-DNase B antibodies in serum as a marker of S: pyogenes infection, and is also useful as a vaccine
                                                                                                                                                  Example 2; Fig 3; 115pp; English.

                                                                                                                                                                                                                                                                The sequence represents the N-terminal fragment of Streptococcus pyogenes DNA-ase-B, which is a marker of S. pyogenes infection. The protein may be used as a diagnostic agent or vaccine for S. pyogenes, or may be used as an aerosol to treat excessive lung viscosity, e.g. in cystic fibrosis.

It is strongly associated with group A Streptocaci and the nucleotide sequences can be used for the microdetection of the gene and provide an early diagnosis of infectious disease caused by the bacteria. (See also AAQ71613-26).

The enzyme can be obtd. on a large scale by expression of encoding DNA (AAT12774) in transformed host cells, esp. Escherichia coll. Inclusion in transformed host cells, esp. Escherichia coll. Inclusion of the leader peptide facilitates purification of the recombinant enzyme. The DNase B is useful in immunoassasys to detect anti-DNase B antibodies in serum as a marker for S. pyogenes infection, and is also useful as a vaccine or for treatment, via

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   c streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and contibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by the treatment or prevention of infection or disease caused by the treatment or prevention of infection or disease caused by the treatment or prevention of infection or disease caused by the treatment of particularly S. agalactiae and S. pyrogenes. Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Stroptococcus in a vaccine or diagnosting (I) or a nucleic acid encoding (I), may be used to detect streptococcus in a compound binds to cused as a vaccine or diagnostic composition. The disease caused by acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

They are useful for content of the presence of or predisposition to a disease associated cowith altered levels of IFN polypeptide or polynucleotide. IFN nucleic cc acids, polypeptides and antibodies are useful for diagnosis, prevention or treatment of variety of immunological and cell proliferative cc disorders, such as autoimmune diseases e.g. lupus erythematosus, cc immunodeficiency diseases such as acquired immunodeficiency syndrome cc (AIDS), graft rejection, viral infections including hepatitis and human claim immunodeficiency virus (HIV), immune-mediated glomerulomephritis, cc haematologic diseases such as aplastic anaemia and chronic neutropenia cc and cancer. In addition they are also useful for treating or diagnosing covarious disorders associated with cell death, including myocardial cc various disorders associated with cell death, including myocardial cc arrophy. IFN nucleic acids and polypeptides are also useful for clarophy. IFN nucleic acids and polypeptides are also useful for compounds which inhibit or enhance IFN activity or function and as targets for the identification of small molecules that care immunostimulatory, immunosuppressive, or stimulate or suppress normal could be a made to the identification of small molecules that are immunostimulatory, immunosuppressive, or stimulate or suppress normal could could be account of the process of the identification of small molecules that the identification of small molecules that are immunostimulatory, immunosuppressive, or stimulate or suppress normal including hypersuppressive, or stimulate or suppress normal could the process of the identification of small molecules that the identification of s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. R8437348-R8G5930 represent human liver single exon encoded peptides of the invention.

Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly
         The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derive from human breast and BT 474 cells. The expression involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA, of human breast, and then measuring the label
                                                                                                                                      New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -
                                                                                                           Claim
                                                                                                                                                                                                                                       Penn SG,

                                                              measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.
                      Note: The sequence data for this patent did not form part printed specification, but was obtained in electronic form
                                                                                                                                                                                       The invention relates to a single exon nucleic acid
                                                                                                                                                                                                                                    Claim 27; SEQ ID NO 30000; 639pp + sequence listing; English.
                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful analyzing gene expression in human fetal liver -
                                                                                                                                                                                                                                                                                                                                                                     WPI; 2001-483447/52.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   30-JAN-2001; 2001WO-US00669
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (MOLE-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21-SEP-2000;

                             ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular systemm e.g. cardiovascular disease. Appertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           04-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                                                                           The present invention relates to human single exon nucleic acid probes (SENP: see AAI1068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.
                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                       Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 27; SEQ ID No 23157; 487pp; English.
